

# PROFIT FROM OUR PROGRESS

## ECONOMIC ANALYSIS FOR FEEDING PERFORMANCE AND CARCASS GRID RESULTS

- 216 head of cattle raised on two Montana ranches then fed and harvested on research at SDSU
- Calves sired by proven Limousin, Lim-Flex, and Angus A.I. sires (1/3 each) on commercial Angus cows.
- Calves split equally into 3 harvest groups (200, 235, 270 days on feed)
- Results reflect feeding performance and carcass grid performance
- Lim-Flex sired calves generated \$23 more profit per head; Limousin sired calves generated \$27 more profit per head than their straightbred Angus counterparts due to their ability to achieve similar quality grade while improving feed efficiency and yield grade.
